In Vitro Evaluation of High Mobility Group Box 1 Protein Removal with Various Membranes for Continuous Hemofiltration

2011

Miho Yumoto,¹ Osamu Nishida,¹ Kazuhiro Moriyama,¹ Yasuyo Shimomura,¹
Tomoyuki Nakamura,¹ Naohide Kuriyama,¹ Yoshitaka Hara,¹ and Shingo Yamada²

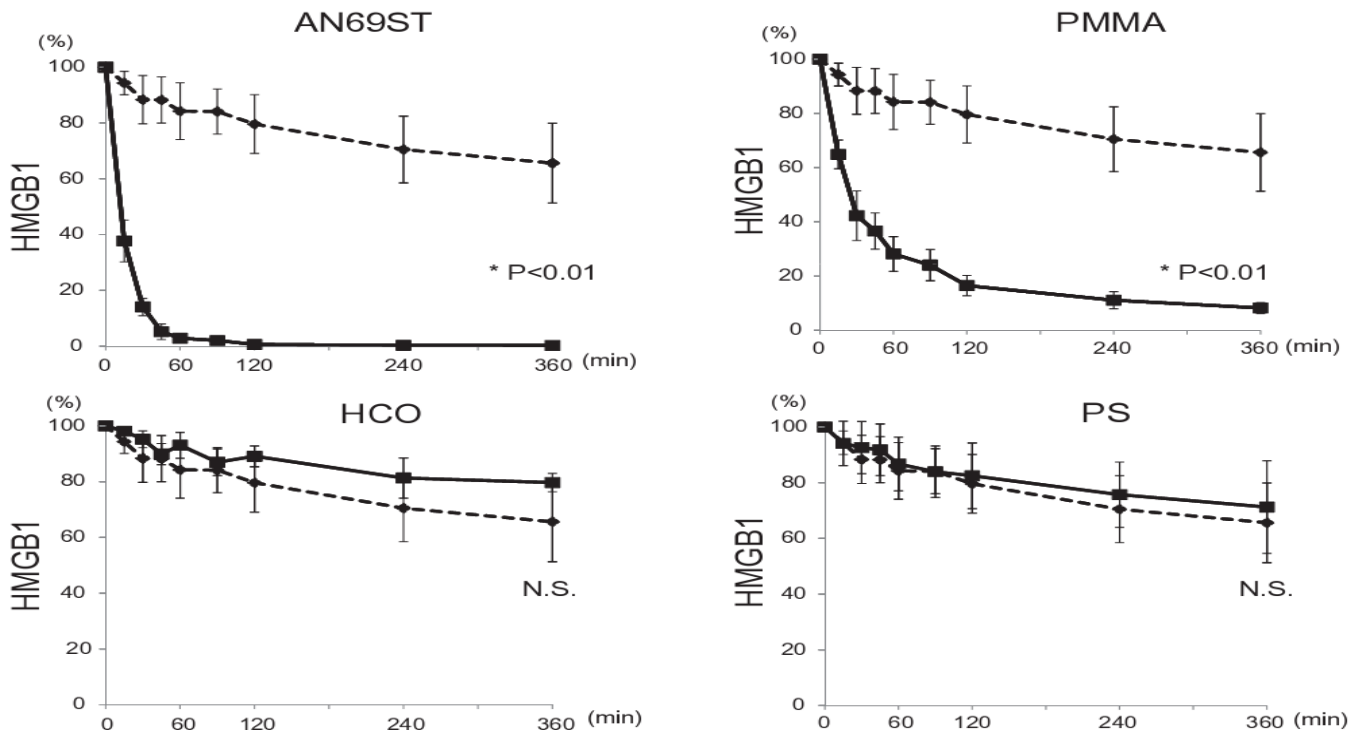

FIG. 4. Time course of high mobility group box 1 protein (HMGB1) levels in the test solution during hemofiltration. Results are shown as mean \pm SD of four experiments. The values at time 0 represent 100%. Dotted line shows the tubing data. These two curves are significantly different from each other ($*P < 0.01$ vs. the tubing). AN69ST, surface-treated polyacrylonitrile; HCO, high cut-off membrane of polyarylethersulfone; PMMA, polymethylmethacrylate; PS, polysulphone.

1. PRIMING

Material Preparation

- HA cartridge
- 12500U heparin
- Syringe
- Rubber hammer
- 3L saline
- Priming Tube Set

1. PRIMING

Statical Heparinization

- Inject 12500U heparin into the cartridge
- Turn the cartridge upside down for over 20 times
- Put the cartridge statically for 30 minutes

2. CONNECTION

Connection [Fig.3]

- Disconnect Luer Lock Connector after the filter
- Connect the Tube B+HA cartridge+Tube C into Prismaflex circulation

Fig.3

3. INSTALL THE HA CARTRIDGE

Step 1

Pause the machine and clip the blood line at both X points before and after the **Luer Lock connector** behind the filter;

Note:

- ① X Point before the Luer Lock connector;
- ② X point after the Luer Lock connector

Step 2

Open the **Luer Lock connector** and connect the cartridge with Tube C & Tube B;

Step 3

Restart the blood circulation.

Post-Hemofilter Diagram

4. REMOVE THE HA CARTRIDGE

Step 1

Connect a saline bag (200-300ml) to injection port 4 and return the blood inside the cartridge;

Step 2

When the blood is diluted from the cartridge, pause the machine and clip the blood line at point ① & ②

Step 3

Remove the cartridge and re-connect the **Luer Lock connector**;

Step 4

Restart the blood circulation.
